

Paramjeet Singh

Full-Stack Engineer | Agentic AI & Backend Systems

Remote (India, GMT+5:30) | paramjeetsinghpawar25@gmail.com | [+91-7734050945](tel:+91-7734050945) | [linkedin](#) | [github](#) | [param.uno](#)

SUMMARY

Full-stack engineer with 1.5+ years building scalable backend systems, ai infrastructure and distributed systems in production. Building autonomous agents, full-stack applications, spanning agent harness, MCP, RAG pipelines over vector embeddings. Comfortable across TypeScript, Python, C++, and Sql, with hands-on experience in event-driven microservices, distributed systems, and LLM-based agent architectures. Looking for remote full-stack / AI engineering roles at early-stage startups.

SKILLS

Languages: TypeScript, JavaScript, Python, C++, SQL

AI / Agentic Systems: LLM Agent Harness, Model Context Protocol (MCP), Tool-Calling Agent Loops, RAG Pipelines, Vector Databases, Prompt Engineering

Backend & Systems: Node.js, REST APIs, WebSockets, Microservices, Event-Driven Architecture, Kafka, Boost.Asio / Boost.Beast

Data & Caching: PostgreSQL, MySQL, MongoDB, Redis, QuestDB

Frontend: React Js, Next Js, Tailwind CSS, HTML, CSS

DevOps & Cloud: Docker, Kubernetes, AWS, CI/CD

PROJECTS

OpenLobster

[Github][Demo][Live]

OpenLobster is an agentic coding tool that reads your codebase, edits files, runs commands, and integrates with your development tools.

- Engineered a Claude Code style autonomous coding platform with a tool-calling agent loop, multi-provider LLM gateway, RAG/vector search, repository indexing, sandboxed file/shell tools, and planning/coding/review workflows for context-aware code generation and execution.
- Architected a production-oriented TypeScript/Node.js system using PostgreSQL, Redis, ChromaDB, REST APIs, SSE, asynchronous workers, persistent sessions, idempotent task execution, and permission-controlled tooling; validated end-to-end behavior with 55 runtime/integration tests across 10 system areas.

WorkPlace

[Github][Demo][Live]

Workplace is a virtual company powered by multi autonomous AI teams.

- Building a multi-agent workplace simulation where users define company structures, roles, departments, permissions, and goals, while AI employees autonomously plan, delegate, collaborate, execute, and report work across teams.
- Developing a real-time 2D pixel-art office interface with Phaser.js where users can interact with CEOs, managers, departments, and individual agents, assign tasks and deadlines, monitor progress, and visualize agent activity, communication, meetings, and idle/work states.

FTX

[Github][Demo][Live]

FTX is a cryptocurrency exchange that lets users trade digital assets, manage balances and positions, and monitor market activity through an trading terminal.

- Designed and developed a modular perpetual futures exchange with a TypeScript/Node.js REST API, C++ matching engine, PostgreSQL/Drizzle, Redis Streams, and Kafka; implemented an in-memory price-time-priority order book using red-black trees with $O(\log n)$ matching.
- Engineered the end-to-end order lifecycle covering validation, idempotent placement, asynchronous event processing, trade settlement, balances and positions, with snapshot-based engine recovery and end-to-end testing for matching, cancellations, rejections, durability, and restart recovery.

Blink

[Github][Demo][Live]

Blink is a developer-first backtesting and algo trading platform, enable users to build, test, and deploy trading strategies on multi exchange setup.

- Built a high-performance, developer-first backtesting engine for building, testing, and optimizing trading strategies against historical data.
- Designed the quantitative research pipeline (data modeling, strategy creation, backtesting) alongside OMS/RMS components for systematic trading workflows.

Experience

100xDevs - Full-Stack Software Engineer

Remote - Nov 2025 – Present

- Designed and developed AI-powered software systems using agentic workflows, LLM orchestration, tool calling, retrieval-augmented generation, and modular architectures for building intelligent and autonomous applications.
- Built and integrated scalable full-stack applications and distributed services, working across backend APIs, PostgreSQL, Redis, asynchronous job processing, real-time communication, authentication, and cloud-oriented infrastructure.
- Engineered reliable and production-oriented systems with emphasis on scalability, performance, fault tolerance, asynchronous execution, observability, and maintainable architecture across complex AI and software engineering workloads.

Peoples Brands Lab - Full-Stack Software Engineer Intern

Remote - Jun 2025 – Nov 2025

- Developed in-house e-commerce products from concept to implementation, contributing across the full software development lifecycle and translating product requirements into scalable, user-focused features.
- Built and integrated full-stack application components and backend services, working across APIs, databases, authentication, business logic, and third-party integrations to support multiple product workflows.
- Collaborated on rapid product development and iteration, debugging complex issues, improving system reliability and performance, and refining architecture as in-house products evolved from initial ideas into usable applications.
